Introducing a security system that works

Nurahn Ryklief
Commercial features writer

THE Passive Millimeter Wave (Passive MMW) scanning system might sound like a mouthful to most, but in reality it is one of the most formidable security systems of this decade.

Technology developed for the military, the Passive MMW is the solution to a non-invasive and healthier way of screening and scanning individuals. Unlike the conventional process, that some would argue to be a bit archaic, that uses radiation as a means to screen individuals, the Passive MMW uses natural energy emitted from human beings.

The security process of detecting objects and personal screening is one that has many challenges and the development of the Passive MMW has aimed to reach all the requirements. The whole body scanner is able to scan every person entering a security area, unlike present systems that are not recommended for screening children, pregnant women and persons with

NEW TECHNOLOGY: Debi Hutton, a director at Axitech, demonstrates how an Iris ID scanner operates.

medical problems – due to radiation.

This leaves a security gap and, in turn, a high-risk of a lapse in security, because as most know, criminals will use any means possible to ensure financial gain.

The mobile unit is currently being used in the United States, Middle East and Asia, and can be used as a stand-alone solution or combined with other security measures such as body searches and ID recognition methods. Another positive is that it can be used discreetly behind dry-walls, therefore, leaving suspects unaware they are being scanned.

Imported by local distributor of electronic security equipment and systems, Axitech, the Passive MMW is a comprehensive solution to scanning. Addressing the shortfalls of its predecessors, the Passive MMW has the capability to identify multiple substances. These include cash/currency, ceramics, composites, contraband, electronic devices, explosives, gels, glass, illicit drugs, liquids, non-ferrous metals, plastics, powders and wood.

Due to its ability to identify all of these products, the Passive MMW is an ideal security solution to corporate companies experiencing profit losses because of theft and missing stock. In a nutshell, the scanner is not limited to detecting contraband and its capabilities are endless.

Another positive the Passive MMW offers is that it is less intrusive to the individual being scanned. Not only is the image produced less graphic, but the physical inspection is not needed (unless something is found on the scan-

ner). A recent survey completed at a Canadian company using the Passive MMW found that female employees preferred the scanner because it is less invasive than full body searches.

In an economic climate that lends itself to the tightening of financial belts, profit-loss is not an option many companies can incur.

It is advisable for companies to ask themselves the following questions regarding their security protocols. If you answer "yes" to any of the following questions, contact Axitech for a security solution that actually works.

Do you have safety concerns with your current full body screening equipment?
Can you detect liquids, plastics, gels and powders?

Do you know if confidential documents, CDs, or DVDs are leaving your premises?

Does your current full body screening equipment reveal anatomical details?

Is your full body screening equipment portable?

History has proven that a security system that has gaps can have devastating consequences, just think of 9/11, the long-term effects of drugs entering your country, the massive loss your company can incur from employee theft or even the negative reputation of your country as a place where luggage theft is common.

Axitech is making a viable security solution available to all companies. There is no time for errors in judgement when the answers are right here.

WHAT IS GETTING THROUGH YOUR SECURITY CHECKPOINTS?

Do you know what your visitors, workforce, passengers or spectators, are concealing past your metal detectors and bringing onto your premises, into your stadiums or removing from your premises?

WE CAN HELP!

No more guessing needed when trying to screen people going through your security access points. Our solutions allow you an easier way to know who to search and pinpoint where to look!

- ▶ Detect concealed objects in as little as 0.5 seconds
- ▶ Scan for explosives, weapons, contraband, stolen electronics, hidden liquids and gels
- ▶ Anatomical details are not revealed thereby eliminating personal privacy issues
- ▶ Completely passive system — no transmission of radiation or energy of any kind
- ▶ Seamless Integration facilitating remote operation and administration of man-traps
- ▶ Monitoring and detection displayed to the operator in real-time
